Data Center Energy Use and GHG Emissions

The Business Case:

Tech sector greenhouse gas emissions are expanding dramatically due to a boom in artificial intelligence and data centers. Powering expanded data center operations requires significant amounts of electricity, which is driving an expansion of fossil-fuel infrastructure along with a delay in coal plant closures. Long-term value may be at risk if tech companies cannot secure sufficient clean energy to support their growth trajectories and avoid mounting pressures associated with bringing more fossil-fuel-based energy emissions to local communities.

Companies:

➤ Alphabet, Meta
